"Semianalytical Method for Calculating the Neutron Field in a Straight One-Dimensional Shield"

V sb. Vopr. fiz. zashchity reaktorov (Problems in Reactor Safety Physics --- Collection of Works), No. 5, Moscow, Atomizdat, 1972, pp 57-63 (from RZh-50. Yadernyye reaktory, No 5, May 72, Abstract No 5.50.60)

Translation: The exact solution of neutron transport boundary value problems can be obtained on the basis of a complete system of elementary solutions of the kinetic equation (the Case method). The boundary value problem for a shielding layer irradiated by an external source is reduced to a system of linear algebraic equations on the basis of the representation of the continuous portion of the spectrum of the transport operator by discrete points. Calculations by the method of elementary solutions in one- and two-group consideration are compared with calculations by the method of discrete ordinates based on the ROZ program. 2 ill., 10 ref.

"Finite-Difference Representation of Formulas of Perturbation Theory for Calculating Reactivity"

V sb. Fiz. yadern. reaktorov (Physics of Nuclear Reactors -- Collection of Works), No 2, Moscow, Atomizdat, 1970, pp 153-167 (from RZh-Fizika, No 4, Apr 71, Abstract No 4V542)

Translation: Changes in the reactivity of fast reactors associated with a change in fuel temperature or the amount of sodium depend both on the magnitude of the perturbation and on the parameters of the critical reactor. The authors pose the problem of determining the change in reactivity with a change in these conditions. As is well-known, the reactivity is a bilinear-fractional functional of neutron flux and importance; namely, $P = L\{\sigma^b, FF^+\}/INF$, where L is the so-called operator of perturbation theory, σ^b is the perturbation cross section, INF is the importance of fission neutrons. Fluxes are determined in the multigroup diffusion approximation by solution of the finite-difference equations by the factorization method. A finite-difference formula for the change in reactivity and the change in reactivity/-reactivity was obtained in the small perturbation approximation. A. G. Promokhov.

"Solution of the Problem on Radiation Transfer With Representation of the Continuous Portion of the Spectrum of the Transfer Operator by Discrete Points"

V sb. Fiz. yadern. reaktorov (Physics of Nuclear Reactors -- Collection of Works), No 2, Moscow, Atomizdat, 1970, pp 82-90 (from RZh-Fizika, No 4, Apr 71, Abstract No 4V547)

Translation: Application of the Case method to transport problems is made difficult by the fact that to find the coefficient $A(v)$ in the integral term one must solve a singular integral equation. An approximation method is proposed for solving the singular integral equation based on representing the integral term in the interval $v \in [-1, 1]$ by a finite sum; the points of division of the interval v_i , $i = 1-n$ are roots of the equation $h_N(v) = 0$, where $h_N'(v)$ is the N-th moment of the expansion of the elementary solution of $\Phi(v, u)$ in Legendre polynomials. N is greater than or equal to the order of anisotropy of the scattering nucleus. The problem of the passage of neutrons through a multilayered plate was solved by this method

CONTROL OF TECHNICAL PROGRESS DISCUSSED

Article by A. Kuchinov, Candidate of Science in Economics, Head of the Central Control of Technical Progress in the Branches of Construction, Economy, and Forestry, in the *Central Scientific Research Institute of Forest Management*, Moscow, No. 4, 1971, pp. 39-44.]

The significant accomplishments in the development of the timber industry during the last 2 decades are the result of using highly productive technical equipment and progressive technology, improvement in organization of labor and production, and a sharp increase in the control-labor ratio and the mechanization of basic work. This has made it possible to increase the volume of logging by almost 50 percent and to increase the over-all output per staff employee by more than 150 percent. The directives of the 24th CPSU Congress have marked the path to further development of the branch: reconstruction of existing timber enterprises, mechanization of labor-consuming work in timber processing, fast production of more modern machines and equipment, improvement in the condition of the roads, improvement in the structure of production, and optimal utilization of wood. The directives also call for the construction of new, highly mechanized lumber manufacturing enterprises, and improvement in the working and living conditions of workers and personnel employed in timber processing.

The successes which have been achieved and the further tasks indicate the position of the reasons for the slow recent improvements in the cost index of timber production and the decrease in the output-capital ratio and the rates of growth of output due largely to labor. Economic research done for the All-Union Central Scientific Research Institute of Forestry in Moscow has shown that the basic reasons for the decrease in the cost index of timber production are the increase in the cost of labor and wood from distant regions of the north, high fuel and

"Detection of Transient X-Radiation by Means of a Streamer Chamber"

Yerevan, Izvestiya Akademii Nauk Armyanskoy SSR, Fizika, Vol. 5, No 4, 1970, pp
267-274

Abstract: A new method is proposed for detecting x-ray transient radiation by means of a streamer chamber with an admixture of Xe. Use of the streamer chamber provides for separate observation of the radiation as well as of the particle, and the presence of Xe provides great efficiency in the detection of photons. It is shown that the average number of transient quanta increases linearly in the electron-energy interval from 1.2 to 2.46 Gev. With the use of foam plastic instead of a layered medium, the efficiency of electron detection with respect to transient radiation equalled 86%.

METHODS FOR CLEAN CONDENSATION OF ATMOSPHERIC MOISTURE FOR ITS

6-251184

Article by O.P. Kholodenko, S.V. Chikishev, Yu.Ye. Sivov, V.P. Stolbov, M.A.

Bashkin and V.V. Tsvetkov, Institute of Aviation Instrumentation, Ministry of Defense of the USSR, Moscow, No. 5, 1971, signed to Press 14 May 1971.

(Inorganic Chemistry Faculty)

The reprocessing of water during prolonged space flights has great significance for reducing the weight of the life support systems [1, 10, 12].

Based on data furnished by a number of authors [1, 10, 12], the daily human requirement for water during a flight of 3 days amounts to about 1 liter; needs 25 L [sic]. Water sources on spacecraft can consist of atmospheric humidity condensates (AHC), using sanitary-hygienic water, transpiration condensates of bicolor and lower plants and condensates of fuel cells. For the immediate space flights, it is primarily feasible to recover water from the least polluted products of AHC type or the transpiration water from plants.

The main source of AHC is the moisture from air breathed by man, containing highly volatile products of his life activity. At the present time, there has been identified in AHC a large number of chemical compounds, both of organic and inorganic nature. Among the identified inorganic admixtures (impurities), we include ammonia, nitrites, nitrites, chlorides, phosphates and sulfates of calcium, magnesium, potassium, sodium and manganese; among organic impurities, we include the lower aliphatic alcohols, fatty acids, fatty acids and hydrocarbons. It is released mainly with exhaled air and in the urine. The release of acetone is also possible through the skin when its (acetone) level in the blood is high.

ARTIFICIAL MINERALIZATION OF WATER INSTRUMENTED DURING SPACELIGHT

By M. I. Shikina, G. V. Chizhevskaya, V. V. Krausnoshchikov, T. I. Andronova

[Article by M. I. Shikina, G. V. Chizhevskaya, V. V. Krausnoshchikov, T. I. Andronova, R. A. Gerasimov, L. N. Slobodkin, E. F. Shchukin. *Vestnik Vsesoyuznogo Nauchno-Issledovatel'skogo Instituta, Biologicheskogo i Radiofizicheskogo Protsessov v Meditsine*, Russian, Vol. 5, No. 2, 1971, pp. 26-31, submitted for publication 12 February 1970.]

Abstract: Data published in the Soviet and foreign literature indicate a need for adding minerals to the water regenerated from human wastes during spaceflight. This paper presents experimental findings concerning the mineralization of regenerated water with solid-phase salts, BaCO_3 and CaCO_3 , and salt tablets. This method has certain advantages over current techniques, yielding drinking water with better organoleptic properties and superior physico-chemical composition.

Since drinking water can be obtained during spaceflight by means of its regeneration from the products of man's vital functions and wastes, hygienists are faced with the serious problem of ensuring that the regenerated water will have the required biocompatibility and chemical composition.

It is known that in its composition regenerated water is close to distilled water and is characterized by the absence of mineral compounds present in natural drinking water which are physiologically important for the human body [Yu. Ye. Syryns].

The biological role of most macro- and microelements present in water has been studied quite well (A. I. Vayns; R. D. Gutavich).

It is well known that iron plays the principal role in supplying the body with mineral compounds. However, it has been established through research that the humanlike intake of individual mineral components with water can also exert a negative effect both on its organoleptic properties and on a number of body physiological functions (I. I. Sheuldin; Margarit).

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE RESULTS ARE ANALYSED OF SCINTIGRAPHY FOR DETERMINATION OF THE CONDITION OF PULMONARY BLOODFLOW IN 73 PATIENTS: 29 WITH CANCER, 24 SUPURATION, 20 PULMONARY TUBERCULOSIS, AND 8 HEALTHY INDIVIDUALS. THE AUTHORS COME TO THE CONCLUSION THAT SCANNING PULMONOGRAPHY IN COMBINATION WITH INDIVIDUAL PULSE COUNT ON EACH LUNG AND PLANIMETRY OF SCANNOGRAMS OBJECTIVELY CHARACTERIZES THE CONDITION OF PULMONARY BLOODFLOW. THE METHOD ALLOWS DETERMINATION OF CIRCULAR DISORDER NOT ONLY IN THE ENTIRE LUNG BUT ALSO IN DIFFERENT PORTIONS. MAXIMUM DISORDERS OF PULMONARY MICRO CIRCULATION WERE DETECTED IN CENTRAL CANCER WITH METASTASES INTO THE REGIONAL LYMPH NODES, IN EXTENSIVE SUPPURATIVE PROCESSES, COMPLICATED BY PNEUMOSCLEROSIS AND IN FIBROUS CAVERNOUS TUBERCULOSIS.

"Prophylaxis of Tularemia in Belorussia"

Minsk, Zdravookhraneniye Belorussii, Vol 17, No 6, Jun 71, pp 47-48

Abstract: Studies conducted in Belorussia during the past 25 yrs indicated that, among cases of tularemia recorded in the enzootic area, 80% and 5-20% occurred among inhabitants of the country and of cities, respectively. The incidence of the disease was 25 times lower in cities than in the country. Country inhabitants were infected mainly while gathering hay or catching water voles (*Arvicola terrestris*), while city inhabitants contracted the disease during vacations in the country. The disease was mostly communicable (in 32.3-75% of cases), but in 1962-63 54.8% of cases occurred as a result of contact with contaminated water. Infection by the respiratory route occurred only in 1951 in connection with winter threshing of rye. It is necessary to immunize against tularemia both the country population and city inhabitants who spend any time in country areas in which tularemia is enzootic. At present the ratio of those who have not been immunized in the population subject to immunization is too high (25-40% in individual rayons). One of the reasons

USSR.

KORSENKO, V. N., and SHIKULOV, V. A., Zdravookhraneniye Belorussii, Vol 17,
No 6, Jun 71, pp 47-48

for this is that no distinction is made between temporary and permanent contraindications. In some cases in which coverage of the population by immunization was complete, tularin tests indicated that the ratio of persons developing immunity following vaccination was too low. This ratio was 35-38.4% in some medical districts of Gomel' and Minsk oblasts 1-2 yrs after immunization, while it was 97-97.5% in the neighboring districts. The reasons for the low ratio in some medical districts were use of improper procedures in administering the vaccine and storing it before immunization. Practical experience shows that immunity lasts for 5 yrs or longer whenever the vaccine has been applied correctly according to directions. It would be best to use the method of cyclic immunization of the total population of enzootic zones during a calendar year. This method (Pilipenko et al, Zh. Mikrobiol., Epidemiol. i Immunobiol. No 6, 25, 1964) has been successfully applied in Stavropol' Kray and elsewhere in the RSFSR. In subsequent years only arrivals from areas in which there is no tularemia and children who have reached the age of 7 yrs are immunized. Reimmunization of the total population is carried out 5 yrs later. In establishing whether or not tularemia is enzootic in any area, it is of

Translation: The authors consider the feasibility of making low-voltage powder
electroluminescent devices. A study is made of the effect which the thickness
of the luminescent layer, the filling of the material in the reflecting and luminescent layers.
dielectric and the permittivity of the material in the reflecting and luminescent layers.
on the distribution of voltage between the reflecting and luminescent layers.
It is shown on the example of a blue electroluminescent device that a bright-
ness of 11-12 nits can be produced at a voltage of 50 V and a frequency of 400
Hz when the thickness of the luminescent layer is 10-13 microns, the weight
ratio of luminescent composition to dielectric is 3 to 1, the effective permit-
tivity of the reflecting layer is 600 or more, and the thickness of the
reflecting layer is 7-20 microns. Test results are presented for experimental
CRM models. Bibliography of 6 titles. Required.

"A Chassis for Electronic Equipment"

USSR Author's Certificate No 255384, Filed 25 Jul 67, Published 31 Mar 70 (from
RZh-Radiotekhnika, No 10, Oct 70, Abstract No 10V416 P)

Translation: This Author's Certificate introduces a chassis for electronic equipment which contains support plates interconnected by hinges and tie braces. As a distinguishing feature of the patent, the rigidity of the construction is improved by inclining the tie braces to the plates on both sides, and beveling the braces at the ends so that they support each other when the chassis is opened.

LIFE IN LIFE SUPPORT SYSTEMS

(Article by G. M. L'vovskiy and M. P. Shilenko; *Voprosy Biologicheskoy Kibernetiki*, No. 3, pp. 22-25, submitted for publication 23 April 1970)

(Life support systems)

BIOLOGICAL KIBERNETICS, Moscow, Kosmicheskaya publication 23 April 1970)

Abstract: On the basis of standard evaluations of higher plants selected for life support systems and experimental data concerning their productivity in an artificial environment, its biochemistry and compatibility with man, it is suggested that some cereals should be extensively studied to determine their possible use as a polyfunctional component of closed ecological systems.

The capacity for higher plants to ensure both gas and water exchange in life support systems makes it desirable that they be thoroughly studied in this aspect. Researchers are faced primarily with the problem of selecting a limited number of plants from among the quarter of a million species of flowering plants known to botanists.

"P. Rudynkin (1964) cited the following criteria for selecting plants or plant media for total mass and biochemical composition: maximum compatibility, and absence of volatile emanations harmful to man; biological air humidity for cultivated plants; coincidence of the optimum temperature methods and equipment for preparing plants; man, as well as the simplicity and

for life support systems; high productivity; capacity for selecting plants for their desirability or reproductive capability; and absence of volatile emanations harmful to man. As additional criteria one can mention coincidence of the optimum temperature and stored and reproduced foods. The weight characteristics of the higher plants

"Regional Distribution of Ixodid Ticks in Turkmenia"

Ashkhabad, Izvestiya Akademii Nauk Turkmenskoy SSR, Seriya Biologicheskikh
Nauk, No 5, 1971, pp 36-42

Abstract: The 31 species and subspecies of Ixodid ticks (of the total of 49 living in Turkmenia) gathered from 699 geographic points and included in the collection of the station are analyzed for the distribution of their natural habitats and their geological and botanic living conditions. *Hyalomma asiaticum asiaticum* proliferates in large numbers in all four regions (clay desert, sandy desert, cultivated river valleys; and southern mountains). *H. detritum* an. *anatolicum*, *H. an. excavatum*, and *H. pl. plumbeum* thrive mainly in cultivated areas. The most numerous species are *H. as. asiaticum* and *H. numidiana turanica* living in sandy desert and *Ornithodoros tartakovskyi* living in clay desert. *Ixodes redikorzevi*, *Haemaphysalis punctata*, *Rhipicephalus schulzei*, and *R. leporis* were recorded for the first time in the republic.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. RADIOACTIVATION SAMPLING FOR AU IN ROCKS AND MINERALS BY USING SUBSTOICHIOMETRIC SEPN. IS VERY RELIABLE AND HAS A VERY GOOD REPRODUCIBILITY (SCATTERING OF PARALLEL DETNS. SMALLER THAN 20PERCENT). IT REQUIRES, HOWEVER, A SAMPLE WEIGHING LARGER THAN OR EQUAL TO 100 MG. THE EFFECT OF NATURAL SCATTERING OF AU ON THE REPRODUCIBILITY OF RESULTS OF RADIOACTIVATION ANAL. WAS INVESTIGATED. THE SCATTERING OF AU DISTRIBUTION IN ROCKS AND MINERALS DEPENDED ON NUMEROUS FACTORS; FORM OF AU OCCURRENCES IN THE MINERAL, STRUCTURAL AND TEXTURAL CHARACTERISTICS OF ROCKS, AND INTENSITY OF SECONDARY ALTERATIONS. THE ERROR OF AN ANAL. DETN. CONSISTS OF 2 COMPONENTS: ERROR RELATED TO THE REPRODUCIBILITY OF THE METHOD (σ_{SUBR}) AND SUMMARY ERROR (σ_{SUBH}) IN DETG. THE AV. CONTENT OF AN ELEMENT IN AN ANALYZED SAMPLE IS, $\sigma_{SUBH} \approx \sigma_{SUBR} \text{ PRIME}_2$. THE σ_{SUBR} EQUALS $\sigma_{SUBR} \text{ PRIME}_2$ PLUS DETNS. OF AU IN ROCKS AND MINERALS, PROCESSED STATISTICALLY, SHOWED THAT THE NATURAL HETEROGENITY IN AU CONTENTS IN AMPHIBOLE GABBRO, BIOTITE AMPHIBOLE DIORITE, BIOTITE AMPHISOLE GRANODIORITE, GRANITE VEIN IN GRANODIORITE, APLITE VEIN IN GRANODIORITE, AND APLITE VEIN IN GABBRO IS MUCH HIGHER THAN THE ERROR OF REPRODUCIBILITY OF THE METHOD (σ_{SUBR} IS SIMILAR TO 20PERCENT). NATURAL HETEROGENITY WAS SO HIGH THAT THE AU CONTENTS IN INDIVIDUAL BATCHES OF THE SAME SAMPLE DIFFERRED FROM EACH OTHER BY LARGER THAN 5 TIMES.

"Basic Characteristics and Parameters of TI-100-2 Shock Generators"

Moscow, Elektrotehnika, No 1, Jan 70, pp 17-21

Abstract: This article presents the test results of two TI-100-2 shock generators, built at the "Elektrosila" plant, designed to be used as sources of electric energy in testing high voltage equipment for breakdown capacity and electrodynamic and thermal strength. The TI-100-2 is a 10 kv., three-phase synchronous 3000 rpm shock generator of 100-Mw rated capacity and 2500-Mw short circuit capacity at 12 kv and 0,0070ohm external reactance. A diagram of the energizing circuit is presented. The operation of two TI-100-2 shock generators was evaluated in relation to their use at the Scientific Research Center for Testing High Voltage Equipment (NITS VVA). The results were used for mastering the parallel running of two generators, which presents

some difficulties in the case of shock generators. For the first time, the basic parameters of shock generators were determined, taking into account the effects of two damper contours: a special damper windings and a massive rotor barrel.

Shock generator characteristics and parameters were determined in accordance with GOST 10169-62. The agreement obtained between the experimental results and the calculated values is satisfactory. Original article has 4 figures and 4 tables.

"Time-Lag Analysis of the MDS-Transistor"

UDC: 621.382.333.3.001.5

Moscow, Radiotekhnika i Elektronika, Vol 17, No 4, Apr 72, pp 856-862

Abstract: Processes of charge behavior in the channel of the MDS-transistor are analyzed for the case of switching by a powerful signal. An equation is derived which describes the high-voltage characteristics of the MDS-transistor with regard to modulation of the charge of the substrate and electrode mobility. The equation is analyzed on a digital computer, and the results are presented in the form of curves for actuating time as a function of the dopant concentration in the substrate and the voltages across the electrodes. The results of the analysis show that accounting for the effects of charge modulation and electrode voltage mobility doubles the actuating and cutoff time. Analytical expressions are found for evaluating the actuating time of the MDS-transistor. The results of this work can be used to determine the frequency limit of the transistor and to evaluate the effect of the inherent time lag of the device on transient processes in high-speed circuits.

228391 DRY FRICTION DAMPER consisting of a shock-absorbing mass 1 with a flexible link 2 with the frame, dry friction shoes 3 coupled to mass 1, and an expansion spring to provide the necessary amount of dry friction. The damper is designed to reduce normal pressure on the contact surfaces when there is a change in direction of the absorbing mass by incorporating an inertia mass 5 which has a flexible link 6 with the shoes. During oscillation in a system inertia mass 5 undergoes various accelerations, and the greater the acceleration on the inertia mass the smaller is the effort with which shoes 3 are pressed against the friction surfaces. With a sufficiently rigid link 6 the acceleration of the inertia mass is virtually equal to the acceleration of the absorbing mass which means that with maximum acceleration of the absorbing mass the dry friction force will be the least.

241486 THERMAL STRAIGHTENING OF THINWALLED FINNED CYLINDERS reduces residual strain by heating the peripheral parts of the fins and outer case of the cylinder to 300-350°C to cope with alloy steel blanks. The thinwalled, split turbine low pressure cylinder has its peripheral fin parts heated as stated and once the peripheral zone has heated through and the outer case, forces begin to operate from inside in the bolt bores joining the cylinder and these produce a moment which bends each half of the cylinder relative to an axial plane perpendicular to the horizontal joint plane and in a direction opposite to the bend which occurs during the primary deformation of the cylinder. Thus this moment restores the concentricity.

SHILINA, N.I.

Coal Chemistry

THIS REPORT IS CONFIDENTIAL
REF ID: A25

DOC 33B, 4:662, 741

CONFIDENTIALITY OF THE PLANNING, DEVELOPMENT AND OPERATION OF COAL CHEMICAL INDUSTRIES, prepared by the Chinese Academy of Coal-Chemical Industries and issued by the Chinese Academy of Production Chemical Industry, was written in 1972, pp 51-543. NOTE:

In the first Plan of the Chinese Central Committee and a five-year plan in the development of the chemical wing of the coke chemical industry, as it was for the chemical industry and coal chemical industry, in 1972 a number of government documents concerning standardizing the chemical industry and other industries of the national economy with raw material and semi-finished coal chemical products and concerning steps to expand the output of chemical products of coking have been published to develop the missions of this Plan.

In the period between 1959 and 1970, 98 chemical shops have been built and put into operation at 45 coke chemical plants of various sizes. In the same period, 10 million metric tons of coke gas and 10 million metric tons of coke oil were produced, 15 million metric tons of coke tar and 15 million metric tons of coke creosote, 10 million metric tons of coke phenol, 10 million metric tons of coke benzene, 10 million metric tons of coke benzyl, two million metric tons of coke phenyl, 10 million metric tons of coke naphthalene, 10 million metric tons of coke benzyl phenol, and 15 million metric tons of coke benzyl benzene.

A characteristic feature of the development of chemical industrial facilities of the coke chemical industry during this time was the increasingly comprehensive processing of the materials, leading to an increase in the absorption of coal resources of coking and to obtaining higher quality products.

Whereas during 1959-1965 about 65 percent of the units introduced were shops to catch the chemical products

"The Nature and Biosynthesis of the Toxin of Fusarium Wilt Pathogen, the
Mechanism of Its Action, and Its Possible Transformation in the Cotton
Plant"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Biologicheskaya, No 5, Sep/
Oct 71, pp 749-754

Abstract: Analysis of purified extracts of *Fusarium oxysporum* f. *vasinfectum* culture liquid confirmed that the toxin of fusarium wilt of the fine-fibered cotton plant is fusaric acid. The severity of wilt depends mainly on the rate of production of fusaric acid by the pathogen. Biosynthesis of this toxin appears to proceed through formation of tryptophan and is inhibited by substances participating in transmethylation, such as cobalt or methionine. Plant resistance is enhanced in the presence of cobalt, vitamin F, and pyridine alkaloids, and is considerably reduced in the presence of thiamine. The mechanism of action of fusaric acid probably involves competition between the product of its decarboxylation, 2-n-butylpyridine, and hydroxylase co-factors. Immunity may be due to deactivation of fusaric acid through its transformation into 2-n-butylpyridine.

"The Effect of Some Chlorinated Organic Pesticides on Serotonin Metabolism"

Moscow, Farmakologiya i Toksikologiya, Vol 34, No 3, May-Jun 71, pp 357-359

Abstract: DDT administered orally in 70 mg/kg dose for 2 days or 3.5 mg/kg dose daily for 5 months (corresponding to 1/5 and 1/100 LD₅₀ respectively) elevated urinary excretion of 5-hydroxyindoleacetic acid by 188 and 105%, respectively. When Lindane was administered in comparable LD₅₀ doses (34 mg/kg for two days or 1.7 mg/kg daily for 3 months) the excretion of 5-hydroxyindoleacetic acid was increased by 160 and 100%, respectively. This suggests that a change takes place in the metabolism of serotonin.

"Investigation of *Bacillus subtilis* Mutants With Altered Capacity to Form Competent Cells"

Moscow, Genetika, Vol 7, No 12, 1971, pp 83-93

Abstract: A total of 110 almost completely incompetent mutant strains were separated from the parent strain *Bacillus subtilis* SB-25. Most of them lacked the competence-inducing factor, were incapable of spontaneous autolysis as a result of the absence of the lytic enzyme and because of a restructured cell wall, and displayed altered sporulation. In some mutants with inhibited autolysis, the transformation capacity was partly restored after addition to the culture of a small quantity of lysozyme. The competence of a few mutants was increased as a result of a higher concentration of the competence factor. In several mutants, the causes of their inhibited competence could not be elucidated. Evidence indicates that the competence factor is not identical with the autolytic enzyme and that the role of autolysis in the process of transformation cannot be reduced to the secretion of the competence factor.

"Dynamic Processes in the Brake Cables When a Lift Container is Stopped by Parachute in a Rigidly Reinforced Channel"

Stal'n. Kanaty., No 9 [Steel Cables, No 9 -- Collection of Works], Kiev, Tekhnika Press, 1972, pp 319-321, (Translated from Referativnyy Zhurnal, Mekhanika, No 10, 1972, Abstract No 10 V1162, by the author's).

Translation: The dynamic loads arising in brake cables and rigid reinforcing wires when a lift container is stopped by PKL parachute traps are studied. It is assumed that the brake cable is a viscoelastic rod with a rigidly attached upper end and free lower end, and that the parachute provides instantaneous "dead" capture with any finite velocity of the container.

FIFTH PLENARY SESSION OF THE BOARD OF THE ALL-UNION SCIENTIFIC MEDICAL HISTORIANS COMMEMORATING THE FIFTIETH ANNIVERSARY OF THE SOVIET UNION
 (articles by Yu.A. Shilinis, candidate of medical sciences; Secretary-General of the All-Union Scientific Society of Medical Historians (Moscow); Moscow, Sovetskoye Izdatelstvo Nauknoi Literatury, Russia, No. 11, 1972, p. 39)

URC: 61(091)1061.22.043

The fifth plenary session of the board of the All-Union Scientific Society of Medical Historians convened on 15-16 May 1972 in Vilnius. In addition to members of the board, about 200 instructors from medical institutes, scientific and practical public health workers participated in the work of the plenum; they were invited by the Central Institute for Advanced Training of Physicians and the chair of social hygiene and public health organization of Vilnius Medical Institute (encl. No. 1). Plenum to a seminar-symposium dealing with urgent problems in history of medicine and public health. The following papers were delivered at the plenum and discussed: "The Problem of Historicism in the light of the Decisions of the 24th Congress of the CPSU and Immediate Tasks of the All-Union Society of Medical Historians in connection with the forthcoming fiftieth Anniversary of the USSR," by Professor M.I. Narinsov; "Fiftieth Anniversary of the Formation of the USSR and Development of Public Health in the Union Republics," by Professor V.G. Yefimov and I.Ya. Shapirko; "The International Association of Medical Historians of the USSR," by Professor B.D. Petrukh; "Participating First All-Union Congress of Medical Historians," by Yu.A. Shilinis, Candidate of Medical Sciences.

In the resolution adopted with reference to the papers, the plenum set some concrete tasks before medical historians to implement the decisions of the 24th Congress of the CPSU and the Decree of the Central Committee of the CPSU "On Preparation for the 50th Anniversary of the Formation of the Union of Soviet Socialist Republics." The heads of the Republic and municipal societies were advised to organize commemorative, scientific conferences, exhibits, publish items in the press summing up the achievements of Soviet public health, medical science, and higher medical education in all Union republics.

It was resolved by the plenum to convene the First All-Union Congress of Medical Historians; it will convene from 3 to 6 October 1973, in

"On the Realizability of Probabilistic Automata by Automata With Random Inputs"

V sb. Metody vychisleniy (Computational Methods--collection of works), vyp. 6, Leningrad, Leningrad University, 1970, pp 127-136 (from RZh-Kibernetika, No 1, Jan 71, Abstract No 1V364)

Translation: In a previous paper (RZhMat, 1968, 12V293) an investigation was made of the problem of synthesizing a self-contained probabilistic finite automaton in the form of a combination of a non-autonomous deterministic finite automaton and a source of a random sequence of symbols. In another paper (RZhMat, 1968, 7V299) a similar problem was examined as applied to a non-autonomous probabilistic finite automaton with marked states operating in some random medium. In the article being abstracted here, the given problem is considered in the general case. A method is proposed for synthesizing and evaluating the required number of inputs. G. Blokhina.

"Hardening of Stamp Steels During High Temperature Thermomechanical Treatment"

Metallovedeniye i Termicheskaya Obrabotka Metallov, No 9, 1973, pp 29-31.

Abstract: The use of high temperature heat treatment and mechanical working can increase the mechanical properties of many tool steels. This article studies the influence of this treatment on stamp steels for hot deformation. Steels studied included types 5KhNV, 4KhSMFS, 4Kh4M2VFS (DI22) and 3Kh2V8F, the latter three of which show a tendency toward dispersion hardening. Billets 19 x 19 mm, after austenitizing, were rolled in two passes at different temperatures with reductions of 37%, then quenched in oil. The heating temperature for the high temperature heat treatment and mechanical working was 850° C for type 5KhNV, 1040° C for type 4KhSMFS, 1070° C for type 4Kh4M2VFS and 1100° C for type 3Kh2V8F. All steels were then tempered at 450-650° C. The tensile strength, impact toughness and thermal stability were determined. It was found that high temperature plastic deformation accelerates the

• Smirnov, M. A., Shteynberg, M. M., Gurevich, L. G., Filatov, V. I., Shilkova, T. S., Metallovedeniye i Termicheskaya Obrabotka Metallov, No 9, 1975, pp 29-31.

breakdown of austenite in all the steels tested, manifested as a decrease in the incubation period and an increase in the breakdown rate. However, the incubation period of the intermediate conversion is increased, the rate and completeness of conversion decrease. Thus, the hardenability of the steels is increased overall. Only the steels with tendencies to dispersion hardening show high stability of thermomechanical hardening during tempering. A significant increase in strength properties of these steels at room temperature and elevated temperatures is observed after deformation below the Ac_3 point. High temperature heat treatment and mechanical working decrease the brittle-rupture tendency of 4Kh5MFS and 4Kh4M2VFS steels only after deformation at 1000° C.

"The Effects of Induced Aeration of a Hypereutrophicated Lake"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Geograficheskaya, No 4,
Jul/Aug 71, pp 48-58

Abstract: A study was made of the effects of induced aeration on the regime of a hypereutrophicated lake during freezing. To eliminate increasing stagnation, which interferes with the use of lake or reservoir water, destratification was achieved by induced mixing and agitation (circulation) of water, resulting in aeration which changed the chemical indices of stagnation and eliminated its undesirable effects. Two electrically-driven compressors pumped air into two perforated rubber hoses laid on the bottom of the lake, with several small-diameter pipe nozzles directed upward, thus keeping open air holes (polyn'ias) in the ice cover. This produced continuous mixing and circulation of the entire water mass of the lake during the freezing, maintained an open water area, and decreased winter stagnation. A complete absence of hydrogen sulfide, a very important component of the winter regime of the lake, was observed, together with a disruption of the iron and

"Possible Toxicity of Potatoes Irradiated by a Flux of Fast Electrons and by γ -Radiation to Retard Sprouting"

Moscow, Voprosy Pitaniya, No 6, Nov/Dec 73, pp 50-55

Abstract: Irradiating potatoes may result in the production of mutations in organisms that eat them. In order to test this hypothesis potatoes irradiated with a dose of 30 kilorads and 20 kilorads of fast electrons were fed to white rats and the results analyzed by a dominant lethal mutations method. A mutation index is calculated reflecting the presence of mutation of dominant traits. A general mortality rate is also calculated. An examination of a number of these indicators and others relative to the number, viability and genetic mutations indicated that in neither case could genetic damage be documented.

"Isothermic Annealing Of Radiation Defects In Ge Irradiated By Fast Electrons
At 77° K"

V.s.b. Radiats. fiz. nemet. kristallov (Radiation Physics Of Nonmetallic Crystals--Collection Of Works), Vol 3, Part 1, Kiev, "Nauk.dumka," 1971, pp 207-210 (from RKh--Lektronika i yeye primeneniya, No 10, October 1971, Abstract No 105404)

Translation: The results are presented of an investigation of the processes of isothermal annealing of Ge at certain stages of reinsertion of the initial concentration of current carriers. It is shown, for example, that at the stage of abrupt reinsertion of the concentration of electrons during annealing of specimens with a resistivity of 1--10 ohm. cm., doped with antimony, after irradiation by fast electrons, a complex process of change of the complexes of defects takes place. For the process of reinsertion of the concentration at $T = 77^{\circ}$ C an activation energy of 1.1 plus or minus 0.1 ev is obtained and for the process of forming a level, 1.7 plus or minus 0.2. During annealing after irradiation at a 240° C temperature on p-type specimens with a resistivity of 5 ohm.cm, the activation energy equals 0.95 plus or minus 0.1 ev at the stage of reinsertion of holes. Here a simple bimolecular process takes place. 4 ref. I.M.

"Concerning 'Photosensitive' Defects in Ge Irradiated at T = 77° K"

V sb. Radiats. fiz. nemet. kristallov (Radiation Physics of Nonmetallic Crystals -- Collection of Works), Vol 3, Part 1, Kiev, "Nauk. dumka," 1971, pp 210-216 (from RZh--Elektronika i vys. primeneniye, No 10, October 1971, Abstract No 10B236)

Translation: Photo-sensitive defects in Ge were studied, which form during irradiation of crystals by electrons at 77°K. If after annealing, the irradiated crystals are illuminated by white light, then the concentration of holes increases and remains constant after cessation of the illumination. N-type specimens doped with Sb and As, which changes the type of conductivity as a result of irradiation, and also p-type specimens doped with Ga were investigated. It is assumed that the effect of the action of light on the concentration of holes is the result of a change of the structure of the defects during heating and illumination. 3 ill. 6 ref. I. V.

"Investigation of the Dynamics of Nonlinear, Automatic Pulsed Systems"

Gor'kiy, Izvestiya VUZov: Radiofizika, Vol 15, No 11, 1972, pp 1692-1699

Abstract: The author considers nonlinear pulse systems in which the nonlinear link may be distinct from the pulse element. Exact equations are derived for determining periodic modes and analyzing their stability. Resonance and nonresonance cases are considered. An approximation method of finding periodic modes is given which generalizes the discrete analog of the harmonic balance method.

"Effect of the Composition of Nonmetallic Inclusions on the Fatigue Limit of
Steel 20"

Moscow, Izvestiya Akademii Nauk SSR, Metally, No 1, Jan-Feb 1970, pp 104-108

Abstract: Qualitative investigations were made of programmed amounts of impurities in steel. In connection with this, experiments were conducted on the formation in steel of non-metallic inclusions of a given chemical composition: plastic silicates, alumina and high-alumina aluminosilicates, semi-brittle silicates, and titanium nitrides. It is shown that the composition of non-metallic inclusions has a significant effect on the fatigue limit of the steel. Of the four types of inclusions studied, the most damaging proved to be plastic unsaturated silicates and titanium nitrides; silica inclusions were the least damaging. The principal negative role of non-metallic inclusions results in the appearance of considerable residual stresses owing to the difference in the physical properties of the inclusions and the metal matrix. These stresses are formed in the metal during unavoidable technological heating and cooling, even before external forces are applied.

"Influence of Smelting Method on the Physical and Mechanical Properties of 15KhS1MFB Steel"

Kiev, Fiziko-Khimicheskaya Mekhanika Materialov, Vol 6, No 6, 1970, pp 93-97

Abstract: The corrosion resistance and long-term strength of ordinary and vacuum-smelted 15KhS1MFB steel were studied in a fused lead-bismuth eutectic. The changes in microstructure, microhardness, coercive force, and electrical resistance of specimens tested for corrosion and long-term strength were studied. It is demonstrated that 15KhS1MFB steel, regardless of the method of smelting, is little influenced by the eutectic Pb-Bi alloy at 470-550°C. The vacuum-smelted steel has practically the same long-term strength as the ordinary steel, but somewhat better plasticity.

"Asymptote of Distribution of Sampling Correlation Coefficient and Its Statistical Applications"

Uch. Zap. Kazan. Un-t. [Scientific Writings of Kazan' University], Vol 130, No 3, 1970, pp 3-17 (Translated from Referativnyy Zhurnal Kibernetika, No 3, 1971, Abstract No 3 VI45 by Ye. Markova).

Translation: Asymptotic formulas are produced for the distribution of the sampling correlation coefficient r and the Fisher transform of its coefficient $L = \frac{1}{2} \ln \frac{1+r}{1-r}$, similar to the asymptotic Edgson-Kramer expansions for sums of independent random quantities. From these expansions, we can easily find asymptotic formulas for the quantiles of the distributions of r and L , asymptotic formulas for the confidence limits of correlation coefficient ρ and asymptotic formulas to estimate the number of observations necessary to differentiate two hypotheses $H_0(\rho < \rho_0)$ and $H_1(\rho > \rho_1)$ with fixed probabilities of errors of the first kind (ϵ) and second kind (ω). The principal results of the work are formulated as two lemmas, two theorems and five results. Calculation of the necessary number of

"Interaction of Diamond, Cubic Boron Nitride, and Graphite with Glass Melt"

Moscow, Doklady Akad. Nauk SSSR, Vol 190, No 6, Jan 70, pp 645-646

Abstract: The authors studied the behavior of fused glass in contact with the surfaces of diamond, cubic boron nitride, and graphite, determining its wetting contact angle and adhesion. It was determined that the diamond and cubic boron nitride differ markedly from graphite by their contact angle, which is $< 90^\circ$ and $> 90^\circ$, respectively. Substituting K_2O for Na_2O in the glass results in drastic decrease of its wetting capacity of diamond and boron nitride surfaces. BaO improves slightly the wetting of diamond, and TiO_2 - both of the abrasive agents. The contact angle is lowered considerably on introduction of V_2O_5 . Substituting PbO for B_2O_3 has a detrimental effect on the diamond but improves the wetting of boron nitride. Best results are obtained by increasing the B_2O_3 content; in the case of diamond and cubic boron nitride the angle becomes almost zero, and in the case of graphite it is lowered to below 90° .

Physical Models of Low-Frequency Noises and Instability in
the Characteristics of HPP Structures. Mochkin, V.S. and
Stepanenko, I.P. In the Collection Mikroelektronika, edited
by T.V. Lurkin, No 5, p 5. Sovetskaya Nauka Publishing House,
1972.

This article gives a classification and comparative
analysis of known physical models of low-frequency noises
and instability in the electrical characteristics of HPP
structures. The interrelationship of the physical mecha-
nisms that produce noises and instability is emphasized.
Several methods are examined for decreasing instability and
noises.

"Dynamic Stability of Rotating Capsule Motion in a Mode of Steady Descent in the Atmosphere"

Uch. Zap. Tsentr. Aerogidrodinam. In-ta (Scientific Writings of the Central Aerohydrodynamics Institute), Vol 3, No 2, 1972, pp 165-171 (from Referativnyy Zhurnal--Raketostroyeniye, No 8, 1972, Abstract No 8.41.80)

Abstract: The conditions of dynamic stability of space motion are examined for an axisymmetrical device with high resistance in the mode of vertical descent at a constant flight velocity and constant angular velocity of rotation relative to the longitudinal axis. A qualitative analysis of the types of motion is conducted by the method of root hodograph and the effect of gravitational forces on dynamic stability is evaluated. 2 figures, 10 bibliographical references.

"A New Technique for Injecting Biologicals"

Moscow, Veterinariya, No 10, 1971, pp 67-69

Abstract: Injection of many animals with biologicals is a costly and time-consuming process because the site has to be carefully treated (the fur shaved and the skin rubbed with a disinfectant or alcohol) to avoid infection. A new injection technique is proposed (for which the authors received a Soviet patent) involving the treatment of boiled needles with maslotimol. A given preparation can be injected subcutaneously or intramuscularly without first shaving the fur. Infection is prevented by mechanical isolation of the needle from the microbes present on the skin and not by chemical action against them. Maslotimol is a sterile vapor mineral oil with 0.2% thymol added as an anti-septic. When used in the amount recommended, maslotimol does not have any bactericidal effect on, for example, vaccine. However, it cannot be used in taking blood from animals.

"Optimization of the Flight Range of a Craft in the Atmosphere Considering the Restriction on the Total Overload"

Uch. zap. Tsentr. aerogidrodinam. in-ta (Scientific Notes of the Central Aerodynamics Institute), Vol 1, No 2, 1970, pp 75-83 (from RZh-Mekhanika, No 10, Oct 70, Abstract No 10 B316)

Translation: This article contains a study of the problem of selecting the control of the angle of attack of a craft braking in the atmosphere during flight to minimum and maximum range considering the restrictions on the magnitude of the total overload. The L. S. Pontryagin principle of the maximum is used. The problem reduces to integration of the equations of two-dimensional motion of the craft and the equations of a conjugate system obtained from the condition of the maximum Hamiltonian of the expanded system. The procedural peculiarities of solving the problem considering the restrictions with respect to overload are investigated, and the results of numerical determination of the optimal trajectories are presented.

Effect of Mass and Aerodynamic Asymmetry on the Dynamics
of a Rigid Body.

PRIMARY OSURCE:

Vsesoyuznyy s"yezd Po Teoreticheskoy i Prikladnoy Mekhanike,
3d. Moscow. Annotasi Dokladov.

ABSTRACT:

The features of uncontrolled motion about the center of mass of a vehicle having the form of a body of revolution are discussed. It is considered that the center of mass is not located on the axis of symmetry of the form, while the ellipsoid of inertia is oriented arbitrarily relative to the longitudinal surface. The fact of revolution instability according to the heel of the type of autorotation is determined by an analysis of static solutions and the equations for the energy of the rotary motion. [AD]
